

# Mathematical Logic and Probability

Wesley Calvert

# Contents

Chapter 1. Introduction: Crosscutting Issues	1
1.1. Ergodic Systems	1
1.2. Entropy	1
1.3. Randomness	1
1.4. Discrete and Continuous Structures	1
1.5. Approximation	1
1.6. Bounding Complexity	1
Chapter 2. Formulating Probability	3
2.1. Axioms for Probability	3
2.1.1. The Prehistory of Probability	3
2.1.2. The Kolmogorov Axiomatization	5
2.2. Reasoning With Probability	9
2.2.1. The Primacy of Probability	9
2.2.2. Probability Logic	14
2.3. Axiomatizing and Computing Conditionality	17
2.3.1. Independence and Bayesian Networks	17
2.3.2. Nonmonotonic Logic and Conditionality	22
2.4. Adapted Spaces and Distributions	24
2.5. Approximate Measure Logic	27
2.6. Continuous First-Order Logic and Metric Structures	29
2.6.1. Continuous First-Order Logic	29
2.6.2. Some Metric Structures	33
2.7. CFO as a generalization	35
Chapter 3. Random Sequences	39
3.1. Normal Sequences	39
3.1.1. Popper and Randomness	39
3.1.2. The Problem of Bases, and Normal Numbers	41
3.1.3. Computability of Normal Numbers	45
3.2. Martin-Löf Randomness	47
3.2.1. Kolmogorov Complexity	47
3.2.2. Martin-Löf Characterization by measures	50
3.2.3. Characterization by Games	52
3.3. Other Notions of Algorithmic Randomness	56
3.3.1. $n$ -Randomness	56
3.3.2. Shnorr Randomness	57
3.3.3. Stochasticity	59
3.4. Effective Dimension	61
3.4.1. Effective Hausdorff Dimension	61

3.4.2. Packing Dimension	65
3.4.3. Box (a.k.a. “Box Counting,” or “Minkowski” Dimension)	65
3.5. An Example: Brownian Motion	67
Chapter 4. Nondeterminism and Randomized Computation	71
4.1. Nondeterminism	71
4.1.1. Nondeterministic Machines	71
4.1.2. NP and the Polynomial Hierarchy	72
4.1.3. Descriptive Complexity	73
4.2. Randomized Turing Machines	74
4.2.1. Complexity Classes Defined by Randomization	74
4.2.2. Effective Completeness for Continuous First Order Logic	80
4.2.3. Pseudorandom Generators and Derandomization	82
4.3. Interactive Proofs	84
4.3.1. Interactive Proofs as Games	84
4.3.2. Interactive Proofs as Proofs	89
4.4. Word Problems	90
4.4.1. Groups with Solvable Word Problem	91
4.4.2. Groups with Generically Solvable Word Problem	93
4.5. Generic and Coarse Computability	96
4.5.1. Generic Computability	96
4.5.2. Coarse Computability	99
4.5.3. Relationships between Generic and Coarse	101
Chapter 5. Pseudofinite Objects and 0–1 Laws	105
5.1. 0–1 Laws	105
5.1.1. Theories of Random Graphs	105
5.1.2. The Almost Sure Theory	108
5.2. Fraïssé Limits	114
5.2.1. Fraïssé’s Theorem	114
5.2.2. Ehrenfeucht-Fraïssé Games and 0–1 Laws	116
5.3. Model Theory of Pseudofinite Structures	118
5.3.1. Pseudofinite Fields	118
5.3.2. Pseudofinite Groups	124
5.3.3. Classes of Finite Structures and Pseudofinite Structures	126
5.4. The Lovasz Local Lemma	130
5.4.1. The Local Lemma and the probabilistic Method	130
5.4.2. The Computable Lovász Local Lemma	133
Chapter 6. Random Structures	137
6.1. Graphons	137
6.1.1. Defining Graphons	137
6.1.2. Invariant Measures	142
6.1.3. Entropy Methods for Graphons and Invariant Measures	147
6.2. Keisler Randomizations	152
6.2.1. The Idea of Randomization Structures	152
6.2.2. The Randomization Theory	156
6.3. Algorithmically Random Structures	159
6.3.1. Algorithmic Randomness and Selection Randomness	159

6.3.2. Defining Algorithmically Random Structures	160
6.3.3. Glasner-Weiss Measures and Their Random Structures	164
6.3.4. Haar Measure and Haar Compatible Measure	168
6.4. Invariant Random Subgroups	170
6.4.1. Defining Invariant Random Subgroups	170
6.4.2. Classifying Invariant Random Subgroups	173
6.5. Probabilistic Boolean Networks	178
6.5.1. An Application: Gene Regulatory Networks	178
6.5.2. Defining Probabilistic Boolean Networks	179
6.5.3. Some Problems on Probabilistic Boolean Networks	180
Chapter 7. Learning and Independence	183
7.1. The Learning Problem	183
7.2. Learning c.e. Sets to Equality and Almost Equality	184
7.3. Probably Approximately Correct Learning and Vapnik–Chervonenkis Dimension	189
7.3.1. Allowing Randomization and Errors	189
7.3.2. Classification by Regression	191
7.3.3. Vapnik-Chervonenkis Dimension	194
7.3.4. The Index Set for PAC Learnable Classes	201
7.3.5. PAC reducibility	203
7.4. NIP Theories	205
7.4.1. The Independence Property	205
7.4.2. Examples of NIP Theories	207
7.4.3. Learning in NIP Theories	208
7.4.4. Learning in Other Theories	209
7.5. Possible Additions	209
Chapter 8. Dynamics	211
8.1. Julia Sets Considered Computationally	211
8.2. Polish Spaces, Orbit Equivalences, and Borel Reducibility	214
8.2.1. Polish Spaces and Orbit Equivalences	214
8.2.2. Borel Cardinality and Reducibility	216
8.2.3. The Glimm-Effros Dichotomy	218
8.3. Classification and Ergodic Theory	220
8.3.1. Amenable Groups	220
8.3.2. Ergodicity	226
8.3.3. Turbulence	231
8.4. Incomparable Equivalence Relations	232
8.4.1. Zimmer Superrigidity	232
8.4.2. Incomparable Relations Under Measure Reducibility	237
8.4.3. Computably Enumerable Equivalence Relations	239
8.5. Universal Minimal Flows	242
8.6. Realizations of Invariant and Stationary Measures	244
8.7. Stochastic and Combinatorial Regularity	247
8.7.1. Szemerédi Regularity Lemma	247
8.7.2. The Furstenberg Correspondence Principle	254
8.7.3. Markov Chains	256
8.8. Probability Group Actions and Generation	257

8.8.1. Probability Groups and Their Actions	257
8.8.2. Quasirandom Groups	257
Chapter 9. Some Problems	257
9.1. Problems on Formulating Probability	257
9.2. Problems on Random Sequences	257
9.3. Problems on Randomized Computation	258
9.4. Problems on Pseudofinite Objects	259
9.5. Problems on Random Structures	259
9.6. Problems on Learning	260
9.7. Problems on Dynamics	260
Appendix A. Preliminaries in Logic	261
A.1. Classical First-Order Logic	261
A.2. Proofs	263
A.3. Recursion and Computability	263
A.4. Sets	263
A.5. Extensions of Classical First-Order Logic	263
